Health-a-thon 2026

FINAL SUBMISSION

Sahara

A phone app for people with a serious illness, like advanced cancer, and their families. Their doctor asks what care they want near the end of life; Sahara writes it on the legal form, and an emergency doctor can read it in one scan.

TEAM NAME Zeros and Ones **TEAM CODE** 37MYUP

Shaik Abdul Basith · Shaik Muhammad Awaiz · Dr Sharada Vinod Kutty · Dr Sujay Halkur Shankar · Shirin Ayub

Try it: sahara.wedevit.in · Android app and website · English, Hindi, Telugu, Urdu, Kannada

Team Overview & Background

Shaik Abdul Basith

Technical lead

Built the website and the AI that writes down the doctor's conversation

Shaik Muhammad Awaiz

Engineer

Built the Android app and the server; tests every version

Dr Sharada Vinod Kutty

Doctor

Lung specialist. Wrote the medical rules the app follows

Dr Sujay Halkur Shankar

Doctor

Lung specialist who treats patients near the end of life. Set the order of questions

Shirin Ayub

Medical student

Designed how patients log their symptoms

Our doctors chose this problem from their own clinics and check every version.

Rituparna P, a lawyer, reviewed our goals-of-care format: consistent with India's living-will framework.

An independent team. The app is on Google Play under the name WeDevit.

Problem Statement and Supporting Evidence

Example story (illustration). A 62-year-old woman with advanced breast cancer.

At the clinic, her doctor asks what treatment she would want if she got very sick. Only her husband is there.

Two months later she is unconscious in the emergency room. Should doctors try to restart her heart (CPR)?

Her children disagree, and nobody can find what she said.

15.6 lakh

new cancer cases in India in 2024.

IARC, GLOBOCAN 2024

98%

of patients whose cancer had spread did not get the comfort care (palliative care) they needed.

Patil et al., 2024

88%

of surveyed city patients wanted to choose their own end-of-life treatment.

IndiaSpend, 2019

11.5%

of doctors (45 of 391) in one hospital were trained in advance directives (recording these wishes).

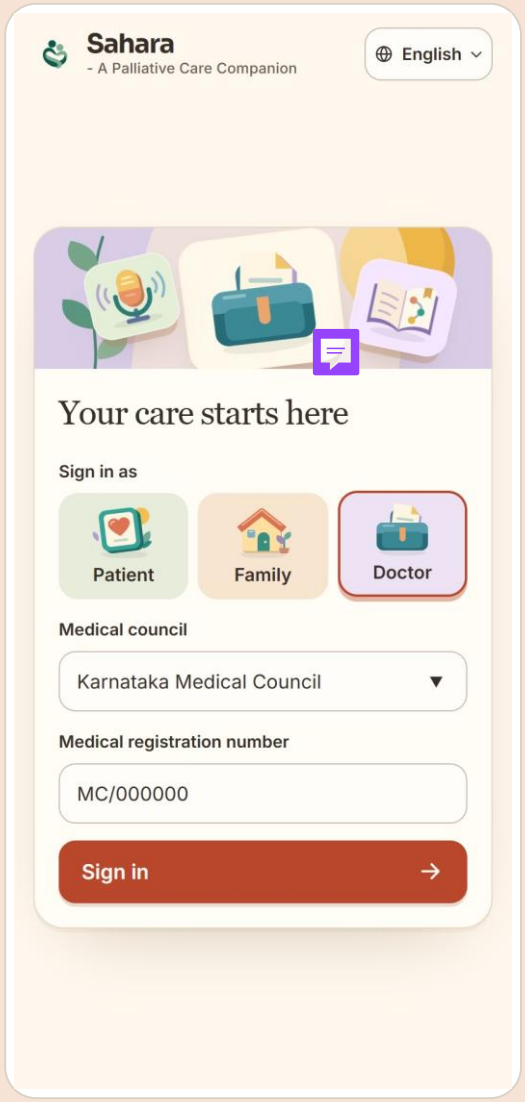

Jacob et al., 2026

What has to change

Her wishes written on the legal form, signed, and found in seconds in an emergency.

Numbers are from studies of different groups, not from Sahara.

Target Users and Use Case

Patient · at home
logs how they feel; says what care they want

Family · at home
sees the same record; reads what the patient said

Their doctor · clinic
leads the conversation; checks and signs the form

Emergency doctor · minutes to decide
scans the patient's QR code to see their wishes

Words used in this deck

Palliative care: care that eases pain and distress in a serious illness.

Goals of care: what treatment a patient wants, or refuses, near the end of life (CPR, ventilator, ICU).

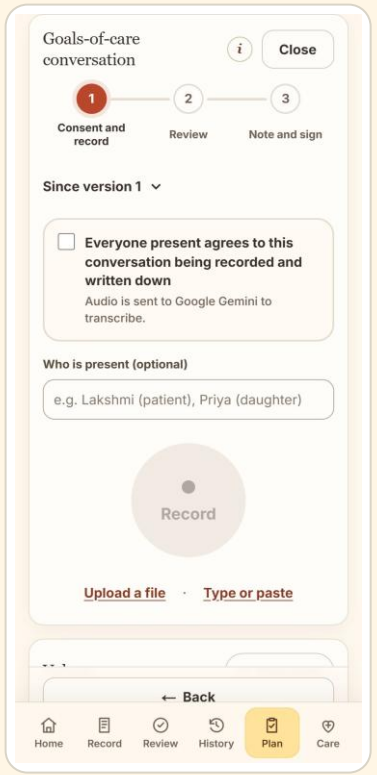

Living will: the legal paper in India that records those wishes.

QR code: a square barcode on the patient's phone or card; a phone camera scan opens their wishes.

Solution Overview, Key Features & Impact (1/2)

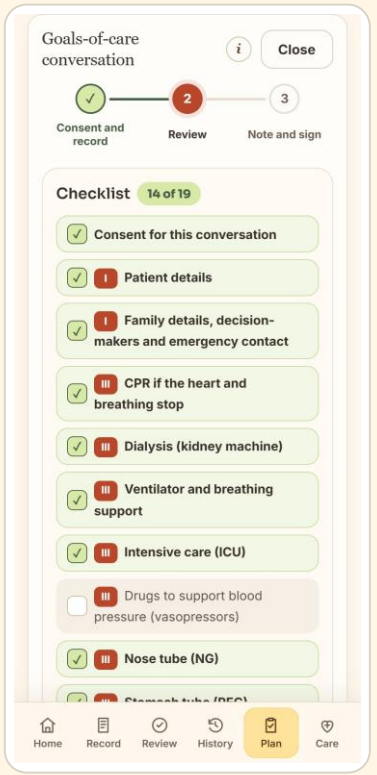

In the clinic: the doctor talks, Sahara listens and writes.

The doctor asks the patient and family what care they want (a “goals-of-care” talk). Today this is often never written down.

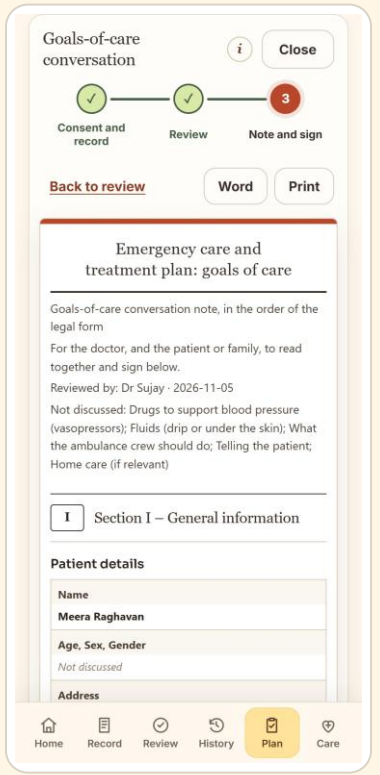

1. Patient agrees, tap Record

Google’s Gemini AI types out who said what

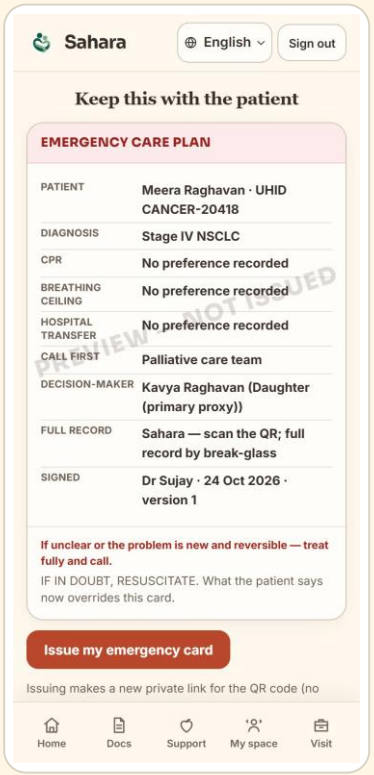

2. A checklist ticks itself

Shows any topic the doctor has not asked yet

3. Answers fill the legal form

India’s living-will form, word for word. Doctor checks it

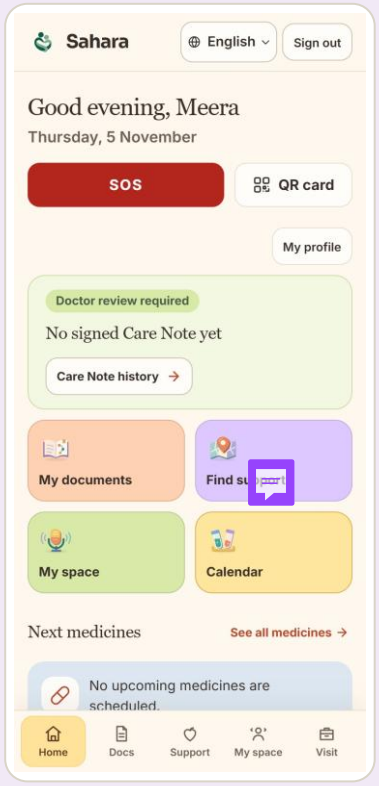

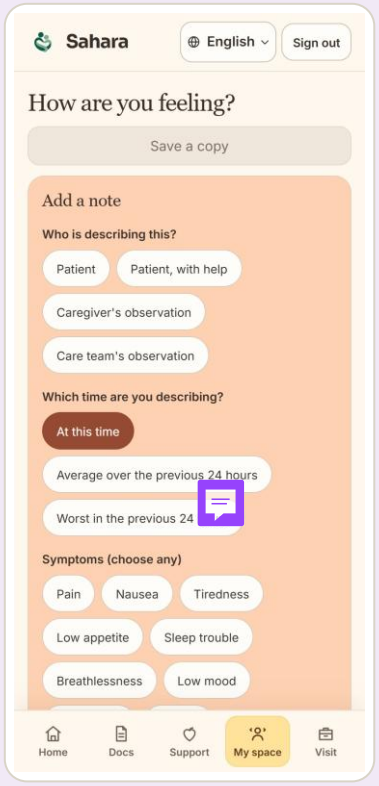

4. Everyone signs on the phone

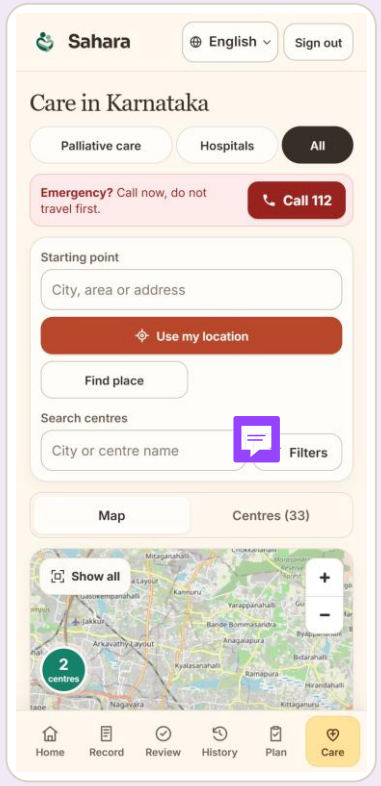

The form locks and opens from a QR code in an emergency

Solution Overview, Key Features & Impact (2/2)

At home, between visits: patients and families log how things are going; their doctor sees it.

How I feel: symptoms, a 0–10 "how upset am I" scale and a body map to mark pain; the doctor sees charts.

Medicines: tick each dose; reminders; photograph a prescription to add it.

Reports: ask a question about a hospital report and get the answer with the line it came from.

Emergency: an SOS button and a QR code with wishes, contacts and medicines.

Help nearby: a map of palliative-care centres, ambulances and support groups.

Family: invited relatives see and add to the same record.

What we expect to change (to be measured in a pilot):

more of these talks written and signed · wishes found in seconds in an emergency · fewer family arguments at the bedside · doctors see problems before the next visit.

Technology, Tools and AI Approach

How a conversation becomes a signed form

Doctor's phone
records only after the patient agrees

→

Our server
keeps the AI password; the phone never has it

→

Google Gemini AI
types out the talk and fills in the form

→

Doctor
reads it, corrects it, signs

→

Locked form
PDF + QR code; any later change cancels the signatures

No internet, or the AI is busy? OpenAI Whisper turns speech into text on the phone itself. If that fails too, the doctor types.

Built with

Android
the phone app

Kotlin + Compose
language and screens of the app

Next.js
the website

Vercel
puts the website online

Supabase
server, sign-in, storage

PostgreSQL
database; each family sees only its own

Google Gemini
AI: speech to text, fills the form

OpenAI Whisper
speech to text with no internet

Google ML Kit
5 languages and read-aloud on the phone

OpenStreetMap
free map of nearby centres

Legal form
fits India's living-will framework (lawyer reviewed)

FHIR
standard format hospital software can read

Build Sprint Journey and Progress

October – November 2026

Built · Doctor / lawyer feedback · Milestone

	MON	TUE	WED	THU	FRI	SAT	SUN
Week 1	5 Oct	6	7	8	9 Shortlisted! Android app + map of centres	10 AI medicine organiser	11 Prescription organiser
Week 2	12	13 Google Play test version	14 Testers invited	15	16 Privacy and account safety	17	18
Week 3	19 Sent to Google Play	20 Mentor review	21	22	23 Hospital survey feedback	24	25 Symptom tracker
Week 4	26 Pain body map	27 Hospital survey live	28 Team meeting: 9 changes Ask your reports	29 Dr Sharada's medical rules	30 Living will + QR code Telugu, Urdu, Kannada	31 Lawyer checks the form	1 Nov Recording → text
	2 Doctor schedule	3 Dr Sujay tests the whole app	4 Legal form word for word 8 practice talks pass	5 Gemini AI + backups Final polish	6	7	8

Blue circle: 5 Nov, the day of this submission. Grey days are outside the 4-week build sprint.

✓ Working now

Patient and family app · doctor's view · recording → signed form · QR code · website live

↻ Changed on the way

Website first, then a real Android app. The AI used to write the note; now the doctor leads and the AI only writes it down.

⚠ Problems we solved

Google's AI was often busy → automatic backups. Legal wording → copied exactly.

… Still to do

Test on many real phones · record a real practice talk with Dr Sharada

Evaluation and User Validation

1. Does it work? Our own tests

877
automatic checks on the Android app: all pass

594 / 594
automatic checks on the website: all pass

8 / 8
practice doctor–patient talks in 6 languages: every answer landed in the right place on the form

4 / 4
questions about a sample hospital report answered correctly

Automatic checks are small test programs that run after every change, so a broken feature is caught before release. The practice talks are made up, not real patients.

2. What experts told us, and what we changed

Dr Sujay Halkur Shankar
doctor, used the whole app on 3 Nov

Said: Is there a guide telling the doctor what to talk about next? And a medicine taken 4 times a day needs 4 ticks.

We changed: Checklist in the doctors' order with a "not yet discussed" prompt; one tick per dose. Team chat: tubes-and-drains tracker, darker text.

Rituparna P
lawyer, reviewed the format on 31 Oct

Said: Use the exact wording of India's living-will form.

We changed: Form copied word for word; signing locks it.

Dr Sharada Vinod Kutty
doctor, wrote our medical rules on 29 Oct

Said: Comfort care must always continue, whatever treatment a patient refuses.

We changed: The app shows this on every signed form.

Not tested yet: with real patients · on many real phones · speech-to-text on real Hindi, Telugu and Kannada recordings · a doctor checking each translation means the same

Safety and Responsible AI

Privacy and consent

- ✓ Recording starts only after the patient ticks “I agree”
- ✓ The AI is used only with that consent
- ✓ Each family sees only their own records

Limits on the AI

- ✓ The AI never suggests treatment
- ✓ If a topic was not discussed, it says so; it does not guess
- ✓ If the AI is down, the phone or the doctor writes it

A person decides

- ✓ The doctor reads, corrects and signs first
- ✓ The patient or family signs too
- ✓ After signing, any change cancels the signatures

For everyone

- ✓ 5 Indian languages, and it reads text aloud
- ✓ Sign with a thumbprint; large text
- ✓ Demos use made-up patients only

Deployment, Cost and Sustainability Plan

Pilot
Start in 1 clinic with our own doctors. Patients give consent as India's data-protection law (DPDP Act) requires.

Fitting in
Works on its own; no hospital software needed. Later it can send records in FHIR, a format hospital software reads.

Who pays
Clinics or charities pay a monthly fee. Free for patients and families.

Growing
Grants first, then palliative-care networks across India.

What it costs	Once	Every month
Servers and website (Supabase + Vercel)	–	₹3,900
Google Gemini AI, per 30-minute talk	–	≈ ₹2 a talk
Setting up and training clinic staff	₹25,000	–
Consent forms and legal check	₹25,000	–
Support from our team	–	₹10,000
Cost per clinic, if 10 clinics share it	**₹5,000**	**≈ ₹1,600**

We would charge ₹1,500–2,000 per clinic a month

Our estimates from public prices: US$1 ≈ ₹86; Supabase $25 and Vercel $20 a month; Gemini ≈ $0.30 per million audio units (a 30-minute talk ≈ 58,000); 100 talks per clinic a month.

What Next? Plans to take initiative forward (if any)

1

Prove it works

Test on many real phones. Record a real practice talk with Dr Sharada.

2

Pilot, 60–90 days

One clinic. Count how many talks get signed and how fast wishes are found.

3

Legal rules

What to do when a patient cannot decide, who may sign for them, and how to cancel a living will.

4

Fund and grow

Grants, palliative-care networks, then link with hospital software.

Can the organisers share our solution publicly? YES

Slides, brief, video and app description. Not patient records, passwords or private code.

Health-a-thon 2026
