Health-a-thon 2026 | Build Sprint Resources from Open Healthcare Network

HealthaThon 2026 <healthathon@reskilll.com> Thu, Oct 15 at 2:18 PM
To: Shaik Abdul Basith <workwithdevit@gmail.com>

Dear Shaik Abdul Basith,

As you prepare for the Build Sprint, we are happy to share an opportunity extended by **Open Healthcare Network (OHC).**

OHC is an **open-source, non-profit organization that builds digital public infrastructure and electronic medical record (EMR) systems for healthcare**. OHC is delighted to extend its support to all shortlisted teams by providing the opportunity to build on **CARE, its existing open-source EMR platform**, and explore its plugins .Teams can build on existing platform capabilities and focus their efforts on the specific workflow or problem they are solving.

They have put together a dedicated page as the starting point for participating teams: Build on Care : Sharing the walkthrough and supporting resources below so you can circulate them to the teams.

1. Video walkthrough - Watch: Building on Care
This is the introductory walkthrough we discussed sharing. Teams can use it as a starting point alongside the documentation and repositories below.

2. Developer documentation
Care plugin documentation The documentation explains Care's plugin architecture and how to develop and integrate extensions. Depending on the use case, teams can build a frontend plugin, a backend plugin, or a combination of the two.

3. AI-assisted development and starter templates

Care plugin scaffold
The scaffold brings together plugin-building guidance, AI coding skills, and frontend and backend templates to help teams structure their development workspace and begin building.
OHC AI coding skills
These reusable skills support AI-assisted development workflows, including code reviews and testing.

4. Example plugins

Care Filly — Backend plugin
A Django plugin demonstrating how to authenticate Care users, check facility permissions and issue short-lived Medispeak session tokens while keeping service credentials on the server. A

useful reference for teams building backend integrations.
Care AI Vision — Frontend plugin
A React plugin that extracts patient details from scanned or photographed forms and fills registration fields for user review. A useful reference for teams extending the Care interface with AI-assisted workflows.
Together, these examples show how teams can build both backend functionality and user-facing features as Care plugins.

What can teams explore?
Potential starting points include:

- Care coordination and follow-up workflows
- AI-assisted clinical documentation
- Operational dashboards
- Integrations with devices or external services

Teams can choose a focused problem and build a working solution around it. For hackathon development, we recommend using synthetic data and documenting the intended user, workflow, setup instructions and known limitations. Any solution intended for clinical use would require appropriate validation and security and privacy review beyond the hackathon prototype.

We encourage you to explore these resources and assess how CARE and its associated tools could support your solution development.

All the best for the Build Sprint!

Regards,
Team Health-a-thon 2026
