When the care conversation gets lost

01 At the clinic

Imagine a 62-year-old woman with advanced breast cancer receiving best supportive care. Her doctor discusses her wishes. Only her husband attends.

02 Two months later

She becomes unconscious and reaches hospital. The doctor asks what she would want if her heart stopped.

03 The family disagrees

Her husband says yes to attempts to restart her heart. Her daughter says no. Her son calls from another city. No one can find the earlier discussion.

04 What could help

A shared, doctor-checked Care Note could give everyone the same information before a crisis.

**The hardest decisions
shouldn't be made without
the right information.**

Why these conversations need a record

15.6 lakh

Estimated new cancer cases in India in 2024.

IARC, GLOBOCAN 2024

98.39%

Estimated unmet need for palliative care among people whose cancer had spread, across 10 cancer types.

Patil et al., 2024

88%

Wanted to choose their treatment near the end of life in a 2019 survey of 2,400+ urban respondents.

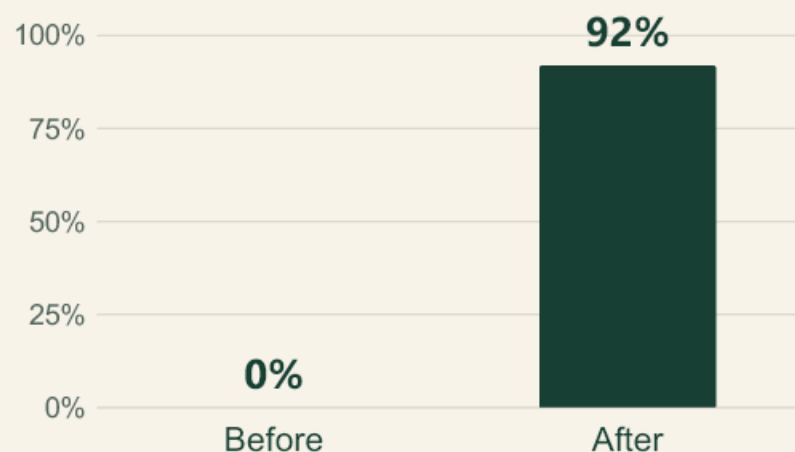

IndiaSpend reporting; seven cities

11.5%

45 of 391 doctors at one hospital had training in advance directives, which record wishes for future care.

Jacob et al., CMC Vellore, 2026

Care discussions written down

A standard process helped one Chennai hospital write down care discussions for 24 of 26 eligible patients.

Advanced pancreatic / colorectal cancer. Thangasamy et al., 2025.

Each study looked at a different group of people. These figures are not results from Saath.

AI turns the conversation into a draft Care Note

The doctor checks it before anyone uses it.

View full conversation

Meera: I want a clear explanation of the next steps in words I can understand. Please include my daughter Ananya in the conversation.
Ananya: I will bring the previous reports to the next visit and write down our questions.
Dr Sujay: We will review the reports together at the next visit.
Meera, we will check that the note reflects what matters to you before it is shared.

Care Note draft Done editing

► Clinical review prompts

Structured clinical form

What matters

A clear explanation of the next steps, with daughter Ananya included in the conversation.

1. Record the conversation

Ask permission to record what the patient and doctor say.

2. AI writes a draft

Separate what was discussed, what was agreed and what still needs an answer.

3. The doctor checks it

Read the original words, correct the note and sign what is right.

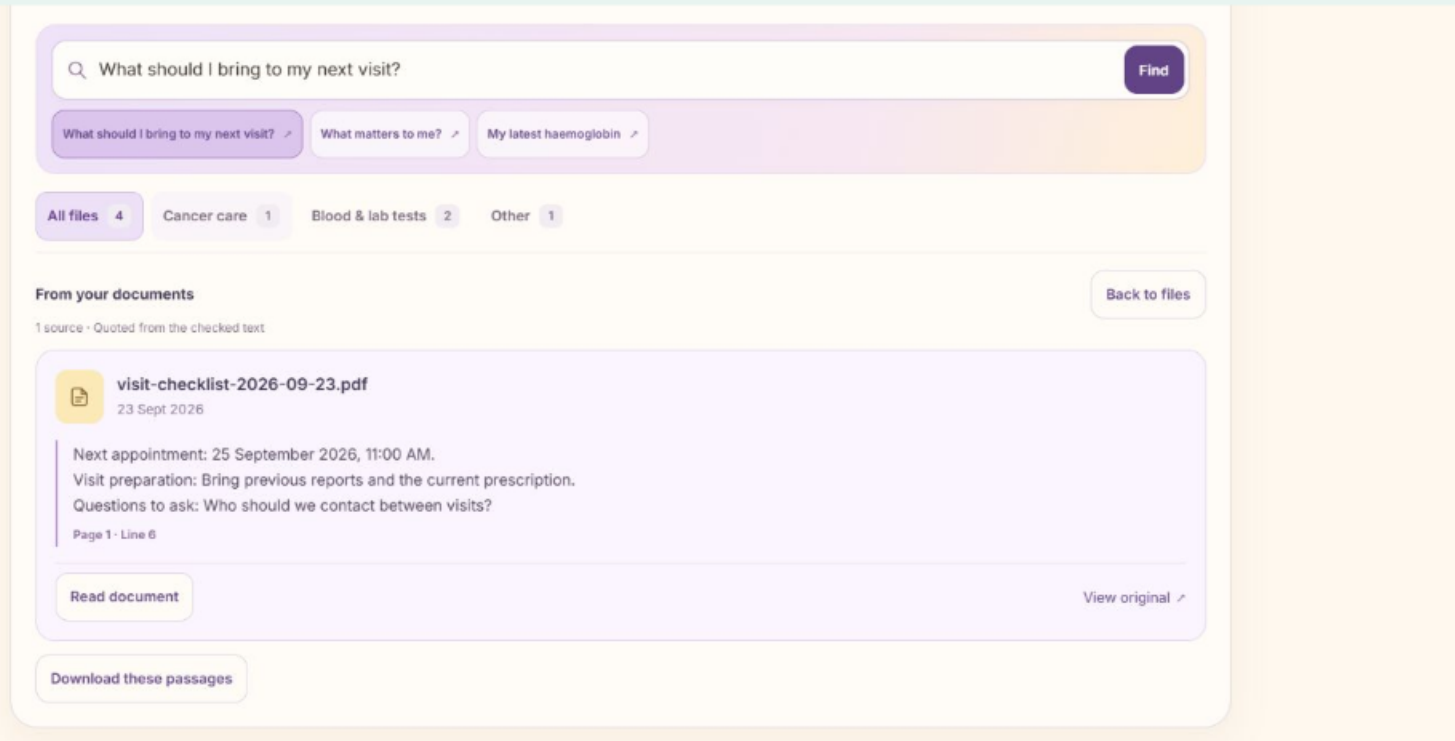

4. Keep each conversation

Start from the earlier note at the next visit. Check changes and keep both versions.

Every part of the note links back to what the patient and doctor actually said.

AI makes the family's records easier to use

Ask about your own reports. See the original passage with the answer.

AI organises the records. The care team decides what treatment the patient needs.

Find an answer in a report

Ask a question. See the exact part of the report the answer came from. Say when it cannot be found.

See what happened when

Put reports in date order. Show earlier treatment dates beside the reports they came from.

Add medicine reminders

Read the names and times from a printed prescription. Let a person check them before adding reminders.

One place for the patient, family and doctor

The latest Care Note and the family's next steps stay together.

Care Note and QR

Find the latest signed version and earlier notes.

Today's plan

See medicine times, appointments and preparation notes.

Someone to help

Ask someone in the family to help. See who has agreed and what is done.

Space and support

Keep a journal and questions. Find best supportive care and support groups.

Does Saath help more care conversations happen?

We propose a 60–90 day study in a clinic, comparing care conversations before and after Saath.

Patient requests

Count patients who ask for a conversation about their care and wishes. Record family requests separately.

Doctor-started discussions

Count conversations a doctor starts. Keep these separate from invitations that did not lead to a conversation.

Conversations written down

Count conversations with a saved Care Note. Record how many the doctor has checked and signed.

Before vs after

Patients whose care discussion was written down ÷ all patients who fit the study’s agreed rules

Also measure how long the work takes, what details were missed and whether doctors have more work.

The linked app shows the workflow. AI, verified sign-in and sharing between phones still need connecting.
